
PROJECT SUMMARY · BRD · FRD

The Construction Module, Explained Simply

What we are building, why we are building it,
and exactly what it will do

This document avoids technical language on purpose. You do not need a software background to read it. Everything is explained the way you would explain it to a friend who has never seen the app. Where a business term is unavoidable, it is explained in plain words the first time it appears.

Project	SMS Pro Ecosystem
Module	Module 01 — Construction Services
Contains	Project Summary · Part A: BRD · Part B: FRD
Prepared for	SMS Pro Venture Private Limited
Prepared by	BudgetAddaa E-Commerce Services Pvt. Ltd. (Appzeto)
Version	1.0 — Simple English Edition
Date	22 August 2026
Companion document	Construction Services Module — Requirement Specification v1.0 (the detailed technical version)

What Is Inside This Document

1	The project in one page	2
2	What BRD and FRD mean	4
PART A – BRD: The Business Requirements		
3	The problem we are solving	6
4	What the business wants to achieve	8
5	Who uses the module and what they get	10
6	The rules the business has set	12
7	What is included and what is not	14
8	How we will know it worked	16
PART B – FRD: What the System Will Do		
9	The complete journey, step by step	17
10	Features for the customer	19
11	Features for the contractor	23
12	Features for your office team	26
13	How money is handled	28
14	Things still to be decided	30
15	What happens next	33

1. The Project In One Page

What SMS Pro Ecosystem is

SMS Pro Ecosystem is one mobile app that brings eight different services together in one place. Instead of downloading eight separate apps, a person downloads one app and uses their single account for everything.

The eight services are:

- 1 Construction Services** — building and construction work (*this document is about this one*)
- 2 QR Safety & Smart Identity** — safety QR codes for people, vehicles and property
- 3 Home Services** — electrician, plumber, carpenter, painter, cleaning

- 4 AMC & Property Care** — yearly maintenance plans for homes and buildings
- 5 Food Delivery** — restaurant ordering and delivery
- 6 Grocery Delivery** — local grocery shopping and delivery
- 7 Ride & Taxi** — booking rides
- 8 Logistics & Parcel** — pickup and delivery of parcels

The big idea behind it

All eight services share the same foundation underneath. A user has **one login, one profile, one wallet** and one place where all their history lives. Book a plumber today and start a house construction project next year — same account, same wallet, same app.

Where construction fits in

Construction is **Module 01** — the first module in the list. The business documents describe it as "*a major revenue-generating component of the ecosystem.*" In plain words: **this is expected to be one of the biggest money-making parts of the whole platform.**

The reason is simple. A food order is worth a few hundred rupees. A taxi ride is worth a little more. A house construction project is worth lakhs. One construction project can be worth more than thousands of food deliveries put together.

The construction module in one sentence

A customer who wants construction work done can find a verified contractor through the app, get a proper written price quote, watch the work progress with photos, and pay the contractor in stages as the work actually gets completed — with the app holding the money safely in between.

2. What BRD and FRD Mean

You will see these two short forms used throughout this document and in every software project. They are simply two different ways of describing the same product.

BRD — Business Requirements Document

Answers: WHY are we building this?

- What problem exists today
- What the business wants to achieve
- Who will use it and what they get
- The rules the business has set
- How we measure success

Written for: owners, managers, investors — people making the business decision.

FRD — Functional Requirements Document

Answers: WHAT will the software actually do?

- Every screen the user will see
- Every button and what it does
- What happens after each action
- What the system checks and blocks
- Feature-by-feature detail

Written for: the development and testing team — people building it.

An everyday way to think about it

Imagine you are building a house.

- The **BRD** is the conversation where you say: *"We need a house for four people. Ground floor plus one. Budget is this much. It must be ready before the monsoon. We need parking."*
- The **FRD** is the detailed drawing: *"Bedroom one is 12 feet by 14 feet. This wall has a window here. The door opens inward. The switchboard goes at this height."*

You cannot start construction with only the first conversation — the mason would have to guess. And the detailed drawing is useless if nobody first agreed how many people will live there. **You need both, and in that order.**

Why the order matters so much

If the FRD is written before the BRD is agreed, the team builds something precisely — but possibly the wrong thing. Fixing it later costs far more than deciding it now. Everything expensive to change is decided in the BRD; everything cheap to change is decided in the FRD.

Where this project stands today — please read this

The business documents shared so far describe the construction module in **sixteen bullet points and one paragraph**. The main technical blueprint runs to 99 pages and covers every other module in complete detail — but it contains **no construction screens, no construction features and no construction plan**.

In BRD and FRD terms: the construction BRD exists at a very high level, and the construction FRD does not exist yet. **This document is our attempt to write both properly, so you can confirm or correct them before development starts.** Section 14 lists the questions only you can answer.

PART A — BRD

The Business Requirements: why we are building this

3. The Problem We Are Solving

Think about how a person gets construction work done today, without any app.

What the customer goes through

- They ask friends and relatives if they know a good contractor. There is no reliable way to check whether a contractor is genuine or skilled.
- Prices are quoted verbally, or on a piece of paper, or over a phone call. There is nothing to compare fairly and nothing to refer back to later.
- Once work starts, the customer has to visit the site or keep telephoning to find out what is happening. If they travel or work long hours, they simply do not know.
- Money is paid in cash or by transfer, whenever the contractor asks. There is often no record of what was paid, for what, or when.
- When something goes wrong, there is no neutral party. It becomes one person's word against another's.

What the contractor goes through

- Finding new customers depends entirely on word of mouth. Work is unpredictable — busy one month, empty the next.
- An honest, skilled contractor has no way to prove it to a stranger. They look identical to a poor one.
- Payments get delayed. Sometimes the customer is unhappy, sometimes they simply forget, and the contractor has no proof of what was agreed.
- Scope arguments are constant — "*this was not included in the price*" — because the original agreement was never written down properly.

The root cause of all of it

Everything above comes from the same thing: **no trusted record, and no neutral middle party**. No verified proof of who the contractor is. No written record of what was agreed. No dated proof of what was done. No controlled way to release money. Every problem in construction traces back to one of these four gaps.

What this module changes

The construction module puts a trusted platform in the middle of that relationship. It verifies contractors before they can take work. It records the price in writing. It records progress with dated photographs. And it holds the money and releases it only as work genuinely gets done.

Neither side has to trust a stranger. **Both sides trust the platform, and the platform keeps the record.**

4. What The Business Wants To Achieve

The business documents list eight goals for this module. Here is each one in plain words, and what it actually means for the product.

#	Business goal	What it means in practice
1	Project Discovery	A customer should be able to open the app and see clearly what kinds of construction work are on offer — without having to already know what to ask for.
2	Lead Generation	Every customer enquiry should be captured properly inside the system, so nothing is lost and every enquiry can be followed up.
3	Contractor Network	Build a proper network of contractors whose licences and documents have actually been checked by your team.
4	Digital Quotations	Replace the paper or verbal quote with a proper itemised price list inside the app, that both sides can see, compare and accept formally.
5	Project Monitoring	Let the customer, the contractor and your office all see the live status of every project at any time.
6	Customer Transparency	The customer should never have to telephone anyone to find out what is happening, what it costs, or what has been paid.
7	Progress Tracking	Break the work into clear stages, and track each stage with dated photographs as proof.
8	Payment Governance	Control the money. Release it in stages, only after the work for that stage is confirmed done.

Two more things the business asked for

Separately, the documents also mention two requirements that do not appear in the list above:

- **Site Assessments** — a proper visit to the site before any price is quoted, so the quote is based on what is really there rather than a guess over the phone.
- **Documentation** — one place to keep all project papers: drawings, agreements, approvals, bills and warranty papers.

What makes construction different from every other service

This matters a great deal, so it is worth being clear about. Booking a plumber and building a house are not the same kind of thing at all.

	Booking a plumber	A construction project
How long it takes	Two hours	Three months to two years

	Booking a plumber	A construction project
How the price is set	Fixed rate, published in advance	Quoted after seeing the site, then negotiated
How it is paid	Once, at the end	In stages, throughout the work
How much it is worth	A few hundred rupees	Several lakhs, sometimes crores
Choosing who does it	App picks the nearest available person	Customer wants to compare and choose
Paperwork involved	None	Drawings, agreements, permissions, bills

The most important finding in this whole document

Every other service in the app is built on the "book a plumber" pattern — short job, fixed price, app assigns someone, one payment at the end. **Construction does not fit that pattern in any single respect.** It needs its own project layer built on top of the existing system, not just a new category added to the existing list. This affects cost, timeline and design more than any other decision in the project, and it is the first question in Section 14.

5. Who Uses The Module And What They Get

The customer

Who they are: a person or a company who wants construction work done — a house, a shop interior, a renovation, an extension.

What they want: a contractor they can trust, a fair price they can understand, and to know what is happening without chasing anybody.

What the app gives them:

- Contractors whose documents your team has already checked
- A written, itemised quote instead of a number over the phone
- The ability to compare more than one quote fairly
- Dated photographs of progress, without visiting the site
- Their money held safely and released only as work is completed
- All papers and all conversations in one place, permanently

The contractor

Who they are: an individual contractor or a construction firm. The business documents describe this user simply as the person who "*handles construction activities*."

What they want: a steady flow of genuine customers, and to be paid on time without argument.

What the app gives them:

- Genuine enquiries delivered to their phone, without hunting for work
- A verified badge and a rating that proves they are trustworthy
- A professional quoting tool instead of a handwritten estimate
- The customer's money already confirmed and held before work begins
- Automatic payment once a stage is approved — no chasing
- A permanent record of exactly what was agreed, ending scope arguments

Your office team (administrators)

Who they are: SMS Pro Venture staff running the platform.

What they want: control over quality, visibility of every project, and the ability to step in when something goes wrong.

What the app gives them:

- A queue of contractor applications with documents to verify
- A live view of every project, its value and its stage
- Automatic alerts when a project falls behind schedule
- Power to hold a payment, reassign work or intervene in a dispute

- Reports on enquiries, conversion, project values and contractor performance
- A permanent record of every action taken, which cannot be edited or deleted

Enterprise customers

Who they are: organisations rather than individuals — companies, schools, hospitals, housing societies, NGOs and government bodies. The platform is already designed to support these as a distinct type of customer.

What is different for them: several staff members from the same organisation may need access to the same project, with different permissions. For example, a site engineer can see progress but only the finance head can approve a payment.

6. The Rules The Business Has Set

These rules come from the main platform blueprint and are already agreed and locked. They apply to construction whether or not construction is mentioned by name. They are written here in plain language because they shape what the module can and cannot do.

Rule 1 — One account for everything

A person has exactly one account across the whole app. If someone books food, then hires a plumber, then builds a house, it is all the same account. A contractor who is also a customer uses one account for both.

Why it matters: the customer never re-registers, and you can see a person's complete history across every service in one place.

Rule 2 — All money goes through the app's wallet

No part of the app is allowed to handle money on its own. Every rupee moves through one central wallet system. Construction cannot build its own separate payment arrangement.

Why it matters: one set of financial records for the whole business, and no way for money to move outside the system unnoticed.

Rule 3 — Financial records can never be changed

Every payment is written into a permanent record that cannot be edited or deleted by anyone, including your own staff and the developers. A balance is not stored as a number that can be altered; it is always calculated from the full list of transactions. To correct a mistake, a new correcting entry is added — the original stays visible forever.

Why it matters: this is standard accounting practice. It means the financial records can be trusted absolutely, and it is what makes holding customer money responsibly possible.

Rule 4 — Every important action is recorded permanently

When a quote is sent, when it is accepted, when a stage is approved, when money is released — the system records who did it, when, and what changed. These records also cannot be edited or deleted.

Why it matters: if there is ever a dispute, there is a complete and neutral account of what happened.

Rule 5 — Construction is a protected service

The platform divides its services into two kinds. Food, grocery, rides and parcels are **open** — a person can browse a little before logging in. Construction, QR Safety, Home Services and Property Care are **protected** — the user must be logged in and verified before they can use anything at all.

Why it matters: construction involves large sums of money and access to people's homes. Anonymous use is not acceptable.

Rule 6 — Contractors must be verified before receiving work

A contractor cannot receive a single enquiry until your team has checked their documents and approved them. The system also tracks expiry dates and warns when a licence is about to lapse.

One existing rule that causes a serious problem for construction

The platform has a rule that a service provider can only work in **one category at a time**. The moment they accept a job, their category is locked, and it unlocks only when that job is finished. This makes complete sense for short jobs — you do not want a plumber accepting an electrical job while already on a call.

But applied to construction, it means that a contractor who accepts a **six-month project is locked for six months** and cannot take any other work at all during that time. One contractor, one project, ever.

No contractor will accept this, and the network cannot grow with this rule in place.

This must be resolved before development begins. Our suggested solution is explained in Section 14, question 2.

7. What Is Included And What Is Not

Included in this module

For customers

- Browsing construction services
- Sending an enquiry
- Finding and comparing contractors
- Booking a site visit
- Receiving and comparing quotes
- Accepting a quote
- Watching progress with photos
- Approving completed stages
- Paying in stages
- Storing project papers
- Chatting with the contractor
- Rating the work at the end

For contractors and your team

- Contractor registration
- Document verification
- Receiving enquiries
- Conducting site visits
- Building itemised quotes
- Managing active projects
- Uploading progress photos
- Requesting stage payments
- Verifying contractors (office)
- Monitoring all projects (office)
- Controlling payments (office)
- Reports and analytics (office)

Not included

These are **not** mentioned anywhere in the business documents, so we have treated them as outside this module. They are listed openly so there is no confusion later. If any of them are actually wanted, please say so now — adding them later costs considerably more.

- Buying or selling construction materials through the app
- Architectural design, drawings or 3D models created inside the app
- Structural or engineering calculations
- Renting construction machinery or equipment
- Labour attendance or wage management
- Applying for government permissions through the app
- Construction loans, financing or EMI options
- Site cameras or sensors
- Material stock and inventory tracking

Named but not yet described

These were asked for, but not explained in enough detail to build. They are covered as questions in Section 14.

- The actual list of construction services to offer
- What a quotation should contain
- How stages and stage payments are decided
- How the platform earns its money from each project

- How enquiries are given to contractors
- Who confirms that a stage is genuinely complete
- What happens when the customer cancels midway
- What happens when the two sides disagree

8. How We Will Know It Worked

A goal you cannot measure is only a hope. These are suggested measures — please adjust the targets to match your own business plan.

What to measure	What good looks like	Why this number matters
Enquiries received	Growing month on month	Shows customers can find and understand the service
Enquiry to site visit	Most enquiries reach a site visit	If enquiries die early, either matching or contractor response is failing
Site visit to quote	Nearly every visit produces a quote	A visit with no quote is wasted effort for everyone
Quote to acceptance	A healthy share converts	The single most important business number in the module
Average project value	Tracked over time	Tells you which services are actually worth promoting
Stages completed on time	Most stages hit their date	Measures whether contractors are reliable
Payment release delay	Short and predictable	Slow releases are the fastest way to lose good contractors
Disputes raised	Low and falling	Rising disputes mean quotes are unclear or verification is weak
Projects completed fully	High	Abandoned projects damage trust on both sides
Customer rating	Consistently high	Ratings drive contractor quality over time
Repeat and referred customers	Growing	The clearest proof the module is genuinely working

PART B — FRD

The Functional Requirements: what the system will actually do

9. The Complete Journey, Step By Step

Before the feature lists, here is the whole thing from beginning to end, as a customer would experience it. Everything in Sections 10 to 13 is a detailed view of one of these steps.

- 01 The customer opens the app and logs in.** Construction is a protected service, so this is compulsory. There are no introduction screens — the user lands straight on their main dashboard.
- 02 They tap Construction Services** and see a list of the kinds of construction work available, each with a short description of what it covers.
- 03 They fill in an enquiry.** What work they want, where the site is, roughly how big it is, what they can spend, and when they want it done. They can attach photographs of the site.
- 04 The system records the enquiry** and sends a confirmation with a reference number, so nothing gets lost.
- 05 Verified contractors are matched** based on the type of work, the location and their availability. The customer can look at each contractor's profile — rating, past work and verification badges.
- 06 A site visit is arranged.** The contractor comes to see the site, records measurements and conditions, and takes photographs. Everything is captured in the app, not on paper.
- 07 The contractor prepares a quote** — a proper itemised list showing each item of work, the quantity, the rate and the amount, plus terms and what is excluded.
- 08 The customer reviews it,** compares it against other quotes if there are any, asks questions through the app, and requests changes if needed.
- 09 The customer accepts a quote.** This is the turning point. The enquiry now becomes a live project, and the agreed price and scope are locked.
- 10 The work is divided into stages,** each with a description, a target date and how much of the total price it is worth.
- 11 The customer puts money into the app.** It is held safely — the contractor cannot touch it yet.
- 12 The contractor completes the first stage** and uploads dated photographs as proof.
- 13 The stage is approved.** The customer, or a supervisor, confirms the work is genuinely done.

14 That stage's payment is released to the contractor automatically. Nobody has to chase anybody.

15 Steps 12 to 14 repeat for each remaining stage, until the work is finished.

16 The project is handed over. Final approval, final payment, all papers stored, and the customer rates the contractor.

The heart of the whole design

Notice steps 11 to 14. The customer's money goes in **before** work starts, so the contractor knows the money is real. But it is released **only** as each stage is genuinely completed and approved. The customer is protected from paying for work not done. The contractor is protected from doing work and not being paid. That single mechanism is what makes the whole module trustworthy — everything else is built around it.

10. Features For The Customer

Finding and asking

C1 Construction services list

A clear list of the kinds of construction work available, organised into categories and sub-categories, each with a short description of what it includes.

Why it matters: most customers do not know the correct term for what they want. Showing them the options is the difference between an enquiry and a closed app.

C2 Service detail page

Opening a service shows what it typically covers, roughly how long such work takes, what to expect, and examples of similar completed projects.

Why it matters: sets expectations early and reduces disappointment later.

C3 Enquiry form

A simple form: what work is needed, where the site is (picked on a map), the plot or built-up area, how many floors, the current condition of the site, the budget range, and when they want it done.

Why it matters: the more the contractor knows before visiting, the more accurate the eventual quote.

C4 Attaching photos and drawings

The customer can attach photographs of the existing site, any drawings they already have, and reference images of what they want the result to look like.

Why it matters: one photograph often communicates more than a page of description.

C5 Enquiry confirmation and tracking

An immediate confirmation with a reference number, and a screen showing the current status of every enquiry the customer has sent.

Why it matters: silence after submitting a form makes people assume it failed.

Choosing a contractor

C6 Contractor list

The contractors matched to the enquiry, showing each one's rating, verification status, specialisation and how many similar projects they have completed.

Why it matters: choice is the main reason a customer would use a platform rather than ask a relative.

C7 Contractor profile

A full page for each contractor: verification badges, trust score, photographs of completed work, the kinds of work they specialise in, and reviews from past customers.

Why it matters: this is where trust is actually created. Without it, every contractor looks identical.

C8 Search and filter

Narrow the list by type of work, distance, rating, verification level or availability.

Why it matters: becomes essential as the contractor network grows.

Site visit and quotation**C9 Booking a site visit**

The customer picks a convenient date and time, receives a confirmation and a reminder, and can reschedule if something changes.

Why it matters: the site visit is where a rough enquiry becomes a real, quotable job.

C10 Receiving the quotation

The full itemised quote arrives in the app — every item of work, the quantity, the rate, the amount, taxes, the total, the terms, what is not included, and how long the price is valid.

Why it matters: replaces the number-over-the-phone with something the customer can actually study, save and refer back to.

C11 Comparing quotations

Where more than one contractor has quoted, the customer sees them side by side and can compare on price, timeline and inclusions.

Why it matters: comparing is genuinely hard on paper. Doing it well is a real reason to use the app.

C12 Asking questions and requesting changes

The customer can ask about any item, or request a revised quote. Every version is kept, so both sides can see exactly what changed.

Why it matters: negotiation happens in every construction deal. Keeping it inside the app keeps the record complete.

C13 Accepting or rejecting

Accepting turns the quote into a live project and locks the agreed price and scope. Rejecting asks for a brief reason, which helps improve future matching.

Why it matters: this is the moment a casual enquiry becomes real business.

Watching the work

C14 Project dashboard

One screen showing everything: which stage the work is at, how much is finished, what has been paid, what is coming next, and anything waiting for the customer's approval.

Why it matters: this screen alone delivers the "customer transparency" goal. It is the screen the customer will open most often.

C15 Stage list and progress

All the stages in order, with each one's target date, current status and how much it is worth.

Why it matters: turns a vague "it's going on" into something specific and checkable.

C16 Progress photo gallery

Every photograph the contractor has uploaded, arranged by date and stage, so the customer can watch the work grow over time.

Why it matters: for a customer living in another city, this is the whole product.

C17 Approving a stage

When a stage is submitted as complete, the customer reviews the evidence and approves it — which is what releases that stage's payment.

Why it matters: this puts the customer genuinely in control of their own money.

C18 Delay alerts

If a stage passes its target date, both sides are notified automatically.

Why it matters: small delays get discussed early instead of becoming big arguments later.

Papers, messages and money

C19 Project documents

All project papers in one organised place — drawings, agreements, approvals, bills, warranty papers. Older versions are kept and clearly marked as superseded.

Why it matters: these papers are needed years later, for resale, insurance or repairs. Most people lose them.

C20 Messaging the contractor

A conversation attached to the project, where photos and documents can be shared. Everything is kept permanently.

Why it matters: keeps important decisions inside the project record instead of scattered across personal messages.

C21 Payment schedule

A clear breakdown of the money: what has been paid, what is being held, what is due next and what remains.

Why it matters: money confusion causes more disputes in construction than the work itself.

C22 Adding money to the project

The customer funds the project through the app's wallet using their normal payment method.

Why it matters: this is what gives the contractor confidence to begin work.

C23 Handover and rating

At the end, the customer confirms final handover, the last payment is released, and they rate the contractor. That rating feeds the contractor's public score.

Why it matters: ratings are what raise the quality of the whole network over time.

11. Features For The Contractor

Joining and getting approved

W1 Registration

The contractor registers with their business details — name, type of business, years of experience and where they operate.

Why it matters: the front door of the supply side. If it is difficult, contractors simply do not complete it.

W2 Declaring what they do

Which kinds of construction work they take on, the size of projects they handle, how far they will travel and how many projects they can run at once.

Why it matters: accurate matching depends entirely on this information being right.

W3 Uploading documents

Licences, registrations, tax documents and certificates. The system tracks expiry dates and warns before anything lapses.

Why it matters: this is the foundation of the entire trust promise to customers.

W4 Verification status

The contractor can see where their application stands, and what is still needed.

Why it matters: waiting without information is the main reason applicants give up.

W5 Building a portfolio

Photographs and descriptions of completed work, shown on their public profile.

Why it matters: good work is the contractor's best sales tool, and most have no way to show it.

Getting work

W6 Enquiry feed

New enquiries matching their skills and area, with the key details visible so they can judge whether it suits them.

Why it matters: a steady flow of genuine leads is the single biggest reason a contractor joins.

W7 Accepting or declining

The contractor takes on an enquiry or passes on it. Declining lets the enquiry move to someone else quickly.

Why it matters: a fast decline is far better for the customer than a slow non-answer.

Site visit and quoting**W8 Visit scheduling**

Proposing and confirming a visit time, with reminders on both sides.

Why it matters: missed visits waste a full day for both parties.

W9 Site visit form

A structured form filled in on site: measurements, site condition, access, water and electricity availability, and general observations — with photographs attached. The app records that the contractor was actually at the site.

Why it matters: this is what makes the quote accurate, and it protects both sides if conditions are disputed later.

W10 Quotation builder

A tool to build the quote line by line — description, quantity, unit, rate, and the amount calculated automatically. Items can be grouped into sections such as civil, electrical and finishing.

Why it matters: this is the module's headline feature. It turns an informal estimate into a professional document.

W11 Terms and exclusions

Space to state clearly what is included, what is not, and the conditions attached.

Why it matters: nearly every construction dispute begins with something the customer assumed was included.

W12 Proposing the payment stages

The contractor sets out the stages and what percentage of the total each is worth, sent along with the quote.

Why it matters: both sides agree the payment plan up front, before any work begins.

W13 Saved templates

Frequently used quotes can be saved and reused, so a similar job takes minutes rather than hours to quote.

Why it matters: speed of quoting directly affects how many jobs a contractor wins.

Doing the work and getting paid

W14 Project workspace

All their live projects in one place, with each project's stages, pending actions and payment status.

Why it matters: most contractors currently track several projects entirely in their head.

W15 Uploading progress

For each stage: how much is complete, notes, and dated photographs as proof.

Why it matters: this evidence is what unlocks the payment, so it is in the contractor's own interest.

W16 Submitting a stage for approval

Marking a stage complete sends it for approval and notifies the customer.

Why it matters: replaces the awkward phone call asking for money with a clean, neutral process.

W17 Earnings and settlements

What has been earned, what has been released, what is still held, and when money reached their bank account.

Why it matters: clear, predictable payment information is what keeps good contractors on a platform.

W18 Trust score

A score built from completed work, customer ratings, complaint history, whether documents are current, and how quickly they respond.

Why it matters: gives contractors a concrete reason to behave well, and gives customers something reliable to judge by.

12. Features For Your Office Team

A1 Construction dashboard

The whole picture at a glance: enquiries received, live projects, total value, stages due, and anything needing attention.

Why it matters: the screen your operations team will keep open all day.

A2 Contractor approval queue

Pending applications with their documents, ready for your team to review and approve or reject with a reason.

Why it matters: this is where platform quality is actually decided.

A3 Contractor management

View any contractor's full record — documents, projects, ratings, complaints and score. Suspend or reactivate them when needed.

Why it matters: you need the ability to remove a contractor quickly if something goes seriously wrong.

A4 Enquiry pipeline

Every enquiry and where it has reached. Enquiries that have gone quiet are highlighted so someone can follow up.

Why it matters: every lost enquiry is lost revenue, and most are lost through simple neglect.

A5 Project register

Every project on the platform, filterable by city, contractor, value, stage or status.

Why it matters: essential the moment you are running more than a handful of projects.

A6 Stepping into a project

When something goes wrong, your team can put a project on hold, hold a payment, reassign the contractor, or close the project — with the reason recorded.

Why it matters: being the neutral party in the middle only works if you can actually act.

A7 Payment control

Oversight of all held money and all releases, with the power to block or approve a release.

Why it matters: a necessary safeguard whenever the platform is holding customers' money.

A8 Managing the service list

Add, edit or remove the construction services on offer, and their descriptions, without needing a developer.

Why it matters: your service list will change often. It should not require a software release.

A9 Reports

Enquiries, conversion rates, average project values, delays, contractor performance and revenue — by city and by period.

Why it matters: these numbers tell you which services and which cities are actually worth investing in.

A10 Full activity record

A permanent, unchangeable record of every action taken on every project by anyone, including your own staff.

Why it matters: your protection in any dispute, and a requirement given that you are holding customer money.

13. How Money Is Handled

This is the part worth reading slowly, because it is where most of the module's value sits — and where mistakes would be most expensive.

The problem with how construction payments usually work

Normally the customer pays the contractor directly, in instalments, based on trust. If the customer pays too early, they risk paying for work that never gets finished. If they pay too late, the contractor cannot buy materials and the work stops. Both sides are exposed.

How the app solves it

- 01 The customer puts money into the app.** It sits in their wallet, marked as reserved for this project.
- 02 The money is held, not transferred.** The contractor can see it is there and knows it is real, but cannot take it.
- 03 The contractor completes a stage** and uploads dated photographs as proof.
- 04 The stage is approved** by the customer or a supervisor.
- 05 Only that stage's money is released** to the contractor. The rest stays held.
- 06 This repeats stage by stage** until the work is done.
- 07 A small final portion may be held back** for an agreed period after completion, in case defects appear.

Why this is fair to both sides

The customer never pays for work that has not been done. Their money is only released against approved, photographed progress.

The contractor never does work without knowing the money exists. It is confirmed and held before they start, and released automatically on approval — no chasing, no excuses, no "next month".

Rules that apply to all of this

- **All money moves through the app's single wallet.** Construction cannot handle payments separately.
- **No payment record can ever be edited or deleted.** Mistakes are corrected by adding a new entry; the original remains visible.
- **Balances are always calculated from the transaction list,** never stored as a number someone could change.
- **Every release is recorded permanently** with who approved it and when.

- **The system prevents double payment.** If a request is accidentally sent twice, the money moves only once.
- **Held, released and pending amounts must always add up** exactly to the agreed project price.

Two money decisions we still need from you

How does the platform earn from each project? A percentage of the project value, a fixed fee, a charge per enquiry given to a contractor, or a contractor subscription? And is it taken at acceptance, at each stage, or at the end? This affects how the payment system is built, so it cannot be left until later.

What happens if a project is cancelled halfway? Who gets the held money, how is completed work valued, and how much notice is required? Every construction platform faces this, and it is better decided calmly now than during a live argument.

14. Things Still To Be Decided

This is the section that needs your answer

These are business decisions, not technical ones. Only SMS Pro Venture can make them. Until they are settled, the development team would be guessing — and a wrong guess here is expensive to undo later. The first eight are the ones that genuinely block progress.

The eight that block progress

#	The question	Why we cannot proceed without it
1	Is construction a full project system, or just another service booking?	This one answer changes the entire design, the cost and the timeline. Our recommendation is a full project system, because construction does not behave like any other service in the app. <i>See Section 4.</i>
2	How do we handle the one-category-at-a-time rule for long projects?	As it stands, a contractor accepting a six-month project is blocked from all other work for six months. Our suggestion: apply the lock only to short individual site tasks, not to the whole project, so a contractor can run several projects at once.
3	What construction services will you actually offer?	No list exists anywhere in the documents. Home Services names six examples; construction names none. This list decides the screens, the matching and the quote formats. <i>Please send the full list of categories and sub-categories.</i>
4	Does the customer choose the contractor, or does the app assign one?	The documents ask for both, and they are opposite products. Choosing means browsing, comparing quotes and deciding. Assigning means the app picks and the customer accepts. Our recommendation: the app suggests a shortlist, the customer chooses from it.
5	Can several contractors quote for the same enquiry?	Decides whether we build quote comparison at all, and changes how enquiries are shared with contractors.
6	What exactly goes into a quotation?	We need the item fields, how tax is shown, how long a quote stays valid and any standard terms. <i>The easiest way to answer: send us one sample quotation in the format you want.</i>
7	Who decides the stages and their payment percentages?	Fixed by you for each service type, decided by the contractor in each quote, or negotiated per project? Changes how flexible the system needs to be.
8	Confirm the money-holding model and what releases it.	Holding customer money brings legal and regulatory responsibilities. We need your confirmation that you intend to hold funds, what triggers release, and what your refund position is.

Important, but not blocking

#	The question	Context
9	Can contractors be companies as well as individuals?	If a firm needs several staff logins with different permissions, that must be designed in.
10	Can a main contractor bring in specialists through the app?	Affects how payments flow to sub-contractors.
11	Is the site visit free or charged?	If charged, it needs its own payment flow and a refund rule if the quote is rejected.
12	How is GST shown on quotes and settlements?	Needed for quote design and for invoicing.
13	Who confirms a stage is genuinely complete?	The customer alone, or your own supervisor too? If the customer alone, a difficult customer can withhold a contractor's payment unfairly.
14	What happens when the customer changes their mind mid-project?	Scope changes are almost guaranteed in construction, and nothing in the documents covers them. Without a proper mechanism, the agreed price cannot legitimately change.
15	What happens when the two sides disagree?	There is no dispute process anywhere in the platform today. With projects worth lakhs, we strongly recommend building one.
16	What documents must the app store?	Needed to organise the document section sensibly.

To confirm

#	The question	Context
17	Are materials, machinery rental or labour management wanted in this phase?	We have assumed not, since they are not mentioned. Please confirm.
18	Should a finished construction project automatically become a maintenance customer?	Your AMC & Property Care module already exists. Linking them is an obvious source of repeat revenue, but was never stated.
19	Do contractors use the same app as plumbers and electricians, or a separate one?	Affects app design and the number of apps to build and maintain.

#	The question	Context
20	Should construction sites have their own QR code?	Could allow contractor check-in and quick site information. Optional.

15. What Happens Next

- 01 You read this document** and tell us whether Part A correctly describes what you want. If anything is wrong, it is far easier to fix now than later.
- 02 You answer the eight blocking questions** in Section 14. A short written reply is enough — it does not need to be formal.
- 03 You share the construction service list** and one sample quotation in your preferred format. These two items alone unlock a large part of the design work.
- 04 We sit together for a working session** to settle the remaining questions. Most of them are quick once the main ones are decided.
- 05 We issue version 2.0 of this document** with everything confirmed. That version becomes the agreed description of the module — the point of reference for everyone.
- 06 We agree the scope, timeline and commercials** for the construction module.
- 07 Development begins**, with both sides holding the same understanding of what is being built.

Why we are asking all this now rather than later

Every question in Section 14 will have to be answered eventually. The only real choice is **when**.

Answered now, they are conversations. Answered during development, they become rework.

Answered after launch, they become problems affecting real customers and real money. The most useful hour anyone can spend on this project is the hour spent answering Section 14.

A note on the companion document

This document is the plain-English version, meant for business readers. There is a companion document — *Construction Services Module — Requirement Specification v1.0* — which covers the same ground in full technical detail: 35 numbered requirements, the complete feature catalogue, database and screen proposals, and the full set of 24 open questions. It is written for the development team. Both documents describe the same module, at different levels of detail.

Document details

Version 1.0 · Simple English Edition · 22 August 2026 · Contains Project Summary, Part A (BRD) and Part B (FRD) · Prepared under the NDA dated 09 July 2026 · Next version to be issued after your response to Section 14.
